

Final SiS data set. The first column gives the line number; the next eight represent the upper and lower state quantum numbers which are separated by a minus sign; column 10, 11 and 12 contain the experimental frequencies, the uncertainties and the residuals (observed frequency minus frequency calculated from the final set of spectroscopic parameters). Column 13 contains the weighting for the few overlapping lines (< 1) or the reference if the measurement is from a previous investigation.

The units are

- MHz, kHz, kHz for the pure rotational data
 - cm^{-1} , 10^{-3}cm^{-1} , 10^{-3}cm^{-1} for the rovibrational data
 (the minus sign for the uncertainties signals that the units are reciprocal centimetres)

The quantum numbers are J, v, F₁, F;

J = F₁ = F for isotopic species not involving (29)Si or (33)S and F₁ and F are redundant;

F₁ = F for isotopic species containing either (29)Si or (33)S and F is redundant and both F₁ and F are rounded up to the next integer;

F₁ is rounded up to the next integer isotopic species containing (29)Si and (33)S, F₁ = J + I(33S), F = F₁ + I(29Si)

Isotopic species with and without resolved hyperfine structure (hfs) were given different state numbers for keeping the line list short.

v is a state number that designates vibrational states AND isotopic species; the actual meaning depends on the definition of the parameters in the parameter file.
